FOR IMMEDIATE RELEASE

PURELINE INTRODUCES NEW SANIPURE SOLUTION SETS— EASY-TO-MIX DISINFECTING CHLORINE DIOXIDE PACKETS

IRVINE, California — PureLine Treatment Systems today announced the introduction of SaniPure™ Solution Sets, easy-to-mix chlorine dioxide packets (ClO₂) designed to safely and effectively deliver 95% pure chlorine dioxide to treat water in a variety of applications including potable water, industrial cooling water, food plant process water, wastewater and bacterial slime control.

“SaniPure™ Solution Sets offer an innovative solution for the rapid delivery of chlorine dioxide to treat applications where traditional generation techniques are too expensive or impractical,” said Dave Perry, President of PureLine.

Each SaniPure™ Solution Set comes with an Activator, Precursor and mixing bag to produce pure chlorine dioxide. The sets can be ordered online at www.pureline.com and are available in four different pre-measured doses that release 2, 10, 25 or 50 grams of ClO₂ in 72 hours at 70° F.

“SaniPure™ Solution Sets are an economic choice for low-use applications that require less than one pound per day of chlorine dioxide,” revealed Perry. “Of course, there are many advantages to using chlorine dioxide. It is effective over a wide pH range, it doesn’t react with ammonia or form THMs, it is a highly soluble gas that can penetrate biofilm layers, and provides three times more biological efficacy than chlorine.”

Individuals who purchase SaniPure™ Solution Sets online will also find helpful tools including a dosing calculator and mixing instructions.

About PureLine

PureLine Treatment Systems is a leading provider of innovative chlorine dioxide generation technologies—both chemical and electrochemical—designed to
